Curl is generally considered to be the tendency of paper or paperboard to curl or roll up in the cross machine direction, usually in response to changes in relative humidity (RH). This is often referred to as “CD curl”. Machine direction curl (MD) is often called “roll set curl”. Curl tendency can be measured using a variety of sample

~~Applied Paper Technology | Curl~~

To predict paper curl, we must seek for moisture travel within the paper in the thickness direction as shown at 1) and 2) of Figure 2. Assuming the paper to be porous media like a sponge, we analyzed

the moisture travel based on the water-vapor-pressure difference inside the paper, and moisture diffusion, taking into account temperature at the time of fusing and paper properties.

~~INVESTIGATING PAPER CURL BY SHEET SPLITTING~~

Paper curl is caused by an excess amount of moisture in the paper. The first step to ensure less paper curl is to store your

paper in a cool, dry area. By doing so, you will reduce the amount of moisture and humidity the paper is exposed to. The next step is to always fan the paper before placing in the machine.

~~How to Fix the Paper Curl Problem~~

Paper has built-in stresses due to the

manufacturing process. If paper is moistened on one side only, the fibers on that side swell, and that side of the paper gets longer, so the paper curls away from the wet side. As the wetter side of the paper dries out, the paper slowly loses its curl and then is flat again.

The paper will curl with the valley or axis of curl in the grain direction since most of the expansion is in the cross-grain direction. This test works best with sized papers because the water penetrates the paper slowly enough to cause a difference in expansion rates between the two sides.
